

Business Problem Statement

A multinational eCommerce company operating across platforms such as Amazon, Jumia, and Souq wants to gain deeper insights into its sales performance, product demand, customer ratings, and revenue trends. The management team has observed fluctuations in monthly revenue, varying product sales across platforms, and differences in customer satisfaction ratings among product categories.

They are particularly interested in identifying which platforms generate the highest revenue, how customer ratings impact sales performance, and which product categories contribute most to overall business growth. Additionally, the company wants to monitor monthly revenue trends to support strategic decision-making, inventory planning, and marketing investments.

You are tasked with analyzing the company's consumer behavior dataset to answer the following overarching business question:

“How can the company leverage eCommerce sales and customer rating data to identify high-performing platforms and categories, improve customer satisfaction, and optimize revenue growth strategies?”

Deliverables

1. **Data Preparation & Modeling (Python):** Clean and transform the raw dataset for analysis.
2. **Data Analysis (SQL):** Organize the data into a structured format, simulate business transactions, and run queries to extract insights on customer segments, sales performance, and purchase drivers.
3. **Visualization & Insights (Power BI):** Build an interactive dashboard that highlights key patterns and trends, enabling stakeholders to make data-driven decisions.
4. **Report and Presentation:** Write a clear project report summarizing your key findings and business recommendations. Prepare a presentation that visually communicates insights and actionable recommendations to stakeholders.
5. **GitHub Repository:** Include all Python scripts, SQL queries, and dashboard files in a well-structured repository.
